In the Claims:

Please replace all prior versions of claims in the application with the following claims.

1. (Currently Amended) A sealing device for providing a seal in vacuum applications for processing systems comprising:

a shaft that substantially extends longitudinally along an axis that is collinear with a central axis of a port between a first zone and a second zone having a pressure differential existing therebetween, where the shaft may be positioned at a range of angles with respect to the central axis of the port for enabling movement of a device in the second zone by an external controller in the first zone;

a shaft seal having a sealing portion and a support portion, the sealing portion being disposed on the shaft, being configured to maintain a vacuum seal about the shaft, and being configured to resist fluid flow between the sealing portion and the shaft, the sealing portion constructed and arranged to allow the shaft to be at least one of slidingly and rotationally moved by the external controller relative to the sealing portion in two or more degrees of freedom to achieve the range of angles to the port; and

a seal mount having a first end, a second end and a flexible member between the first and second ends that enables movement of the first end relative to the second end in at least one degree of freedom, the first end being sealingly engageable to at least a portion of the support portion of the shaft seal, the second end being sealingly engageable to an engagement surface about the port ~~into a vacuum process chamber and being configured to maintain a the vacuum seal for preventing contamination of the vacuum process chamber.~~

2. (Currently Amended) The sealing device of claim 1, wherein the flexible member defines a transition space in the first zone, the transition space being in fluid communication with ~~the port vacuum process chamber.~~

3. (Previously Presented) The sealing device of claim 1, wherein the flexible member allowing movement of the shaft seal in at least two degrees of freedom relative to the central axis of the port.

4. (Original) The sealing device of claim 1, wherein the port further comprises a port size and a portion of the shaft extending through the port has a shaft size, the port size being substantially larger than the shaft size.

5. (Previously Presented) The sealing device of claim 1, wherein the port comprises a central axis, and the shaft seal is movable to allow the shaft to be angularly offset relative to the central axis of the port.

6. (Previously Presented) The sealing device of claim 1, wherein the shaft seal is movable to allow the shaft to be laterally offset relative to the central axis of the port.

7. (Original) The sealing device of claim 1, wherein the sealing portion of the shaft seal sealingly engages with a cylindrically-shaped portion of the shaft.

8. (Cancelled)

9. (Original) The sealing device of claim 1, wherein the sealing portion sealingly engages the shaft so that the shaft may be rotationally moved, but not slidingly moved, relative to the sealing portion.

10. (Original) The sealing device of claim 1, wherein the support portion includes a housing having a shaft bore with an inner surface, the shaft bore constructed and arranged to allow the shaft to pass through the shaft bore.

11. (Original) The sealing device of claim 1, wherein the support portion of the shaft seal is characterized as being substantially rigid.

12. (Original) The sealing device of claim 11, wherein the shaft seal includes a portion constructed from at least one member of the group consisting of metals, powder metals, ceramics, metallo-ceramics, rigid plastics, and combinations thereof.

13. (Original) The sealing device of claim 1, wherein the flexible member includes at least one of natural rubber, silicone rubber, and elastomeric polymer materials.

14. (Previously Presented) The sealing device of claim 1, wherein the flexible member includes a plurality of undulations.

15. (Original) The sealing device of claim 1, wherein the flexible member includes a bellows portion.

16. (Original) The sealing device of claim 1, further comprising a first retaining ring constructed and arranged to sealingly engage a first end of the flexible member to the shaft seal.

17. (Original) The sealing device of claim 16, further comprising a first O-ring positioned between the first retaining ring and the shaft seal.

18. (Currently Amended) The sealing device of claim 1, further comprising a second retaining ring constructed and arranged to sealingly engage a second end of the flexible member to ~~an~~ the engagement surface of the ~~vacuum process chamber~~.

19. (Original) The sealing device of claim 18, further comprising a second O-ring positioned between the second retaining ring and the engagement surface.

20. (Original) The sealing device of claim 1, wherein the flexible member includes a flexible collar.

21. (Original) The sealing device of claim 20, wherein the shaft is moveable in a reciprocating manner relative to the shaft seal and the port.

22. (Original) The sealing device of claim 20, wherein the shaft is moveable in a rotating manner relative to the shaft seal and the port.

23. (Original) The sealing device of claim 1, wherein the sealing member comprises:
a first seal member, a second seal member, and a spacer member positioned
therebetween, each of the seal members having a first surface and a second surface, the first
surface being supported by the support portion and the second surface being sealingly associated
with the shaft.

24. (Original) The sealing device of claim 23, further comprising a differential space
between the first and second seal members, the differential space being fluidly connectable with
a vacuum source.

25. (Original) The sealing device of claim 24, wherein the differential space is located
between the spacer seal member and the support portion.

26. (Original) The sealing device of claim 25, wherein the seal mount defines a
transition space in the first zone, and the differential space is fluidly connectable to transition
space.

27. (Currently Amended) A floating shaft seal for providing a vacuum seal for
processing systems comprising;

a reciprocating and rotating shaft, wherein the shaft substantially extends longitudinally
along an axis that is collinear with a central axis of a port and is passed from a zone at ambient
air pressure through an opening in a vacuum process chamber, the vacuum process chamber to a
zone having a substantially lower pressure than ambient, where the shaft may be positioned at a
range of angles with respect to the central axis of the port ~~for enabling movement of a device in~~
~~the vacuum process chamber~~ by an external controller from the zone at ambient air pressure;

a sealing member constructed and arranged to allow the shaft to move responsive to the
external controller relative to at least a portion of the sealing member in two or more degrees of
freedom to achieve the range of angles in the port, the sealing member being disposed on the
shaft, being configured to maintain a vacuum seal about the shaft, and being configured to resist
fluid flow between the sealing member and the shaft; and

a flexible mounting collar having a first end opening and a second end opening, the first end opening being sealingly engageable with the sealing member, the second end opening sealingly engageable about an engagement surface about the opening and configured in the vacuum process chamber to maintain the vacuum seal for preventing contamination of the vacuum process chamber.

28. (Currently Amended) The shaft seal of claim 27, wherein the opening ~~in the vacuum process chamber~~ has a central axis, and the sealing member and the flexible mounting collar are constructed and arranged to allow the shaft to be offset relative to the central axis.

29. (Original) The shaft seal of claim 28, wherein the sealing member and the flexible mounting collar are constructed and arranged to allow the shaft to be rotated about an axis transverse to the central axis.

30. (Original) The shaft seal of claim 27, wherein the sealing member is constructed and arranged to allow the shaft to rotate relative to at least a portion of the sealing member.

31. (Original) The shaft seal of claim 27, wherein the sealing member is constructed and arranged to allow the shaft to slide along a longitudinal axis of the shaft relative to at least a portion of the sealing member.

32. (Previously Presented) The shaft seal of claim 27, wherein a portion of the sealing member is disposed on a cylindrical portion of the shaft.

33. (Cancelled)

34. (Cancelled)

35. (Withdrawn) An ion beam measuring device comprising:
a vacuum chamber having an inside and an outside, the vacuum chamber being defined by a plurality of walls and housing an ion beam projected from a beam source, one of the

plurality of walls having an opening;

a shaft having a first end and a second end, the shaft passing through the opening in one of the plurality of walls in the vacuum chamber;

a measuring device operatively engaged to the first end of the shaft;

a control unit positioned on the outside of the vacuum chamber and engaged with the second end of the shaft; and

a seal device mounted adjacently to a wall of the vacuum chamber, the seal device having a flexible member and sealingly engaging the shaft so the shaft is free to at least one of rotate and slide relative to the seal device, the seal device being sealingly engaged about the opening in one of the plurality of walls and resisting fluid flow from outside the vacuum chamber through the opening in one of the plurality of walls, the flexible member allowing the shaft to be offset relative to the opening in one of the plurality of walls while sealing engagement is substantially maintained with the shaft.
